

AlaskaPak: NPS AKSO Functions Package V5.0

Created May 14, 2002

GIS Team
Alaska Support Office
National Park Service

What's New

AlaskaPak V5.0 now utilizes "Templates" for the layout wizard. These templates are embedded in the extension, along with the NPS logo. Templates can be customized by the user and accessed through the layout wizard. System administrators can also modify the default templates to regional standards as needed (and compile their version of the extension). Current templates are compliant with the NPS Messaging standards.

Additionally, Collar importing tools have been consolidated and ARGOS satellite data are included as one of the options.

Bug Fixes

- Layout wizard – text is not appearing. This should (!) go away with the new template approach.
- NPS logo not found in layout wizard. Should be fixed with new template approach.

Enhancements

- Import collar data is now on the View GUI AlaskaPak menu. This prompts for which format you wish to import (ats, telonics, or ARGOS). Now a theme is created for the selected file, and added to the active view.
- Layout wizard is now compliant with NPS standard messaging. The wizard uses templates. Custom templates can be created by users and accessed through the wizard.

The help file discusses how to customize the standard templates, or create new templates for distribution with the extension.
