

Wildland Firefighter Research Summaries – 2001 and 2002 Fire Seasons Human Performance Laboratory

Dept. of Health and Human Performance
University of Montana

Funded by Missoula Technology Development Center, U.S. Forest Service

Contents:

1. Blood Pressure Responses During The USFS Arduous Wildland Firefighter Pack Test
2. Carbohydrate Feedings Increase Self-Selected Work Rates During Arduous Wildfire Suppression
3. Changes In Sustained Aerobic Fitness During A Season Of Arduous Wildfire Suppression.
4. Fitness, Workrates And Fatigue During Arduous Wildfire Suppression
5. Physical Fitness Related To Self-Selected Work Rate Of Type One (Hotshot) Crew Members During An Arduous 9-Day Fire
6. Hours Of Reported Sleep During Random Duty Assignments For Four Type I Wildland Firefighter Crews.
7. Liquid Carbohydrate Feeding Improves Self-Selected Exercise Performance During A 24km Hike
8. Fatigue, Sleep And Mood State In Wildland Firefighters.
9. Changes In Salivary IgA During Arduous Wildfire Suppression Relative To Work Shift Length

Acknowledgements:

This research was directed by Steven E. Gaskill, Ph.D. and Brent C. Ruby, Ph.D.

We would like to thank MTDC and Brian Sharkey for their support in helping with and funding these projects. We are also indebted to the fire crews and supervisors who participated and willingly gave of their time and effort to make these data possible. We would also like to thank the undergraduate students who helped with the blood pressure and the 24km hike projects.

Finally, we would like to thank Dr. Dan Heil of the Montana State University for his help with the activity monitors and our graduate students, Dustin Slivka and Eli Lankford who helped with several of the summer studies.
